## Some References

- Besides this book, I made this slides under the references of other two books:

A Mathematical Introduction to Robotic Manipulation

Introduction to Robotics
Mechanics and Control

Modern Robotics

## Chapter 6: Hand Dynamics and Control

| Contents | Goal |
| :--- | :--- |
| 1. Lagrange's Equations with Constraints | Calculate the dynamics of a mechanical system subject to Pfaffian <br> constraints |
| 2. Robot Hand Dynamics | Derive the equations of motion for a multifingered hand <br> manipulating an object |
| 3. Redundant and Nonmanipulable Robot Systems | Derive more complex equations of motion for redundant or <br> nonmanipulable robot system |
| 4. Kinematics and Statics of Tendon actuation | Describe the kinematics of tendon-driven systems |
| 5. Control of Robot Hands | Introduce an extended control law for constraints-involved system <br> and other control structures |

## Recall

- We only need to recall Jacobian

The manipulator Jacobian relates the joint velocities $\dot{\theta}$ to the endeffector velocity $V_{s t}$ and the joint torques $\tau$ to the end-effector wrench $F$ :

$$
\begin{array}{lll}
V_{s t}^{s}=J_{s t}^{s}(\theta) \dot{\theta} & \tau=\left(J_{s t}^{s}\right)^{T} F_{s} & \text { (spatial) } \\
V_{s t}^{b}=J_{s t}^{b}(\theta) \dot{\theta} & \tau=\left(J_{s t}^{b}\right)^{T} F_{t} & \text { (body). }
\end{array}
$$

If the manipulator kinematics is written using the product of exponentials formula, then the manipulator Jacobians have the form:

$$
\begin{array}{rlrl}
J_{s t}^{s}(\theta) & =\left[\begin{array}{llll}
\xi_{1} & \xi_{2}^{\prime} & \cdots & \xi_{n}^{\prime}
\end{array}\right] & \xi_{i}^{\prime}=\operatorname{Ad}\left(e^{\widehat{\xi}_{1} \theta_{1}} \ldots e^{\widehat{\xi}_{i-1} \theta_{i-1}}\right) & \xi_{i} \\
J_{s t}^{b}(\theta) & =\left[\begin{array}{llll}
\xi_{1}^{\dagger} & \cdots & \xi_{n-1}^{\dagger} & \xi_{n}^{\dagger}
\end{array}\right] & \left.\xi_{i}^{\dagger}=\operatorname{Ad}_{\left(e^{-1} \widehat{\xi}_{i} \theta_{i}\right.}^{\cdots} e^{\widehat{\xi}_{n} \theta_{n}} g_{s t}(0)\right)
\end{array} \xi_{i} .
$$

## Recall

- Robotic dynamics: deriving the equation of motion including $q, \dot{q}, \ddot{q}$ and $\tau$
- Forward dynamics: find joint accelerations
- Given $q, \dot{q}$ and $\tau$, find $\ddot{q}$
- Inverse dynamics: find joint forces and torques
- Given $q, \dot{q}$ and $\ddot{q}$, find $\tau$
- Two approaches for solving robot dynamics problem.

1. Lagrange's equations

- Energy-based
- Determine and exploit structural properties of the dynamics

2. Newton-Euler equations

- Rely on $f=m a$
- Often used for numerical solution of forward/inverse dynamics

1．The equations of motion for a mechanical system with Lagrangian $L=T(q, \dot{q})-V(q)$ satisfies Lagrange＇s equations：
－Lagrange＇s equation

$$
\frac{d}{d t} \frac{\partial L}{\partial \dot{q}_{i}}-\frac{\partial L}{\partial q_{i}}=\Upsilon_{i}
$$

where $q \in \mathbb{R}^{n}$ is a set of generalized coordinates for the system and $\Upsilon \in \mathbb{R}^{n}$ represents the vector of generalized external forces．

## －Newton－Euler equations

－$m$ ：mass of the body，assume origin of $\{b\}=C o M$
－$F^{b}$ ：total force and moment acting on the body
－$m v^{b}$ ：linear momentum of the body
－ $\mathcal{I} \omega^{b}$ ：angular momentum of the body

2．The equations of motion for a rigid body with configuration $g(t) \in$ $S E(3)$ are given by the Newton－Euler equations：

$$
\left[\begin{array}{cc}
m I & 0 \\
0 & \mathcal{I}
\end{array}\right]\left[\begin{array}{c}
\dot{v}^{b} \\
\dot{\omega}^{b}
\end{array}\right]+\left[\begin{array}{c}
\omega^{b} \times m v^{b} \\
\omega^{b} \times \mathcal{I} \omega^{b}
\end{array}\right]=F^{b},
$$

where $m$ is the mass of the body， $\mathcal{I}$ is the inertia tensor，and $V^{b}=\left(v^{b}, \omega^{b}\right)$ and $F^{b}$ represent the instantaneous body velocity and applied body wrench．
－Lagrange＇s equation for open－ chain robot manipulator

3．The equations of motion for an open－chain robot manipulator can be written as

慣性力＋遠心力・コリオリカ＋ポテンシャルエネルギーに伴う力
＝関節に加えられるトルクとそれ以外の力

$$
M(\theta) \ddot{\theta}+C(\theta, \dot{\theta}) \dot{\theta}+N(\theta, \dot{\theta})=\tau
$$

## Recall

Common contact types

$$
F_{o}=G_{1} f_{c_{1}}+\cdots+G_{k} f_{c_{k}}=\left[\begin{array}{lll}
G_{1} & \cdots & G_{k}
\end{array}\right]\left[\begin{array}{c}
f_{c_{1}} \\
\vdots \\
f_{c_{k}}
\end{array}\right]
$$

Grasp map: map the contact forces to the total object force

Definition 5.2. Force-closure grasp
A grasp is a force-closure grasp if given any external wrench $F_{e} \in \mathbb{R}^{p}$ applied to the object, there exist contact forces $f_{c} \in F C$ such that

$$
G f_{c}=-F_{e} .
$$

## Definition of force closure

## Definition 5.3. Internal forces

If $f_{N} \in \mathcal{N}(G) \cap F C$, then $f_{N}$ is an internal force. If $f_{N} \in \mathcal{N}(G)$ and $f_{N} \in \operatorname{int}(F C)$, then it is called a strictly internal force.

## Definition of internal forces

$$
J_{h}\left(\theta, x_{o}\right) \dot{\theta}=G^{T}\left(\theta, x_{o}\right) \dot{x}_{o}
$$

## Grasp constraints

Relationship between forces and velocities

## Contents of This Talk

- Recall
- Lagrange's Equations with Constraints
- Pfaffian constraints
- Lagrange multipliers
- Lagrange-d'Alembert formulation
- The Nature of nonholonomoic constraints
- Robot Hand Dynamics
- Redundant and Nonmanipulable Robot Systems
- Kinematics and Statics of Tendon Actuation
- Control of Robot Hand

## Constraints

- A constraint restricts the motion of the mechanical system by limiting the set of paths which the system can follow.
- e.g. An idealized planar pendulum $q=(x, y) \in \mathbb{R}^{2}$
- All trajectories of the particles must satisfy the algebraic constraint:

$$
x^{2}+y^{2}=l^{2}
$$

- This constraint acts via constraint forces, which modify the motion to insure the constraint is always satisfied.
- Holonomic constraint vs. nonholonomic constraint

## Constraints

- Holonomic constraint vs. nonholonomic constraint
- Let's explain simply using some mechanical system examples with constraints

- Configuration space can be represented by vector:

$$
\circ(x, y, \theta) \in \mathbb{R}^{3}
$$

- These four joints always satisfy this equation:

$$
\dot{y}-\dot{x} \cdot \tan (\theta)=0
$$

- (Constraint involves velocity)
- It's a nonholonomic constraint this system could move between two arbitrary states with some constraint of velocity.

## Constraints

- Holonomic constraint vs. nonholonomic constraint

Planar four-bar linkage

- Configuration space can be represented by vector:

$$
\circ\left(\theta_{1}, \theta_{2}, \theta_{3}, \theta_{4}\right) \in \mathbb{R}^{4}
$$

- These four joints always satisfy these equations:

$$
\begin{aligned}
L_{1} \cos \theta_{1}+L_{2} \cos \left(\theta_{1}+\theta_{2}\right)+\cdots+L_{4} \cos \left(\theta_{1}+\cdots+\theta_{4}\right) & =0, \\
L_{1} \sin \theta_{1}+L_{2} \sin \left(\theta_{1}+\theta_{2}\right)+\cdots+L_{4} \sin \left(\theta_{1}+\cdots+\theta_{4}\right) & =0, \\
\theta_{1}+\theta_{2}+\theta_{3}+\theta_{4}-2 \pi & =0 .
\end{aligned}
$$

- Degree of Freedom: one
- It's a holonomic constraint because it reduces degrees of freedom in the system

## Holonomic/Nonholonomic Constraint

- If we set
- $n$ : dimensions of configuration space $q=\left(q_{1}, \ldots, q_{n}\right)$
- $k$ : number of independent constraints
- A question: whether the system could be moved between two arbitrary states without violating the velocity constraint?
- Holonomic constraints can be represented locally as algebraic constraints:
- $h(q)=0, h: \mathbb{R}^{n} \rightarrow \mathbb{R}^{k}$
- Answer: No
- Nonholonomic constraints can be represented as
- $h(q, \dot{q})=0$
- Answer: Yes

## Holonomic constraint

- Holonomic constraints can be represented locally as algebraic constraints:
- $h(q)=0, h: \mathbb{R}^{n} \rightarrow \mathbb{R}^{k}$
- And the matrix $\frac{\partial h}{\partial q}=\left[\begin{array}{ccc}\frac{\partial h_{1}}{\partial q_{1}} & \cdots & \frac{\partial h_{1}}{\partial q_{n}} \\ & \ddots & \\ \frac{\partial h_{k}}{\partial q_{1}} & \cdots & \frac{\partial h_{k}}{\partial q_{n}}\end{array}\right]$ is full row rank
- Constraint force $\Gamma=\frac{\partial h^{T}}{\partial q} \lambda$,
- Constraint forces do no work (will be explained later)

## Pfaffian constraint

- Pfaffian constraint: generally we write velocity constraints as:
$A(q) \dot{q}=0, \quad$ where $A(q) \in \mathbb{R}^{k \times n}$ represents a set of $k$ velocity constraints.
- This is the form of However, if there exist a vector-valued function $h: Q \rightarrow \mathbb{R}^{k}$ such that
- $A(q) \dot{q}=0 \quad \Longleftrightarrow \quad \frac{\partial h}{\partial q} \dot{q}=0$.
- Pfaffian constraint is integrable
- Pfaffian constraint is equivalent to a holonomic constraint
- Otherwise, pfaffian constraint which is not integrable is an example of a non-holonomic constraint (not all).
- Constraint forces $\Gamma=A^{T}(q) \lambda$,

## Dynamics with Constraints

- Goal: derive the equations of motion for a mechanical system with configuration $q \in \mathbb{R}^{n}$ subject to a set of Pfaffian constraints.
- Mechanical system: constraints are everywhere smooth and linearly
- Lagrangian: $L(q, \dot{q})$ kinetic energy minus potential energy
- Constraint: $A(q) \dot{q}=0 \quad A(q) \in \mathbb{R}^{k \times n}$.
- Let's write the equations of motion considering the constraint can affects the motion additionally:

$$
\frac{d}{d t} \frac{\partial L}{\partial \dot{q}}-\frac{\partial L}{\partial q}+\underbrace{A^{T}(q) \lambda}_{\begin{array}{c}
\text { Constraint } \\
\text { forces }
\end{array}}-\Upsilon=0
$$

- $\lambda_{i}, \ldots, \lambda_{k}$ : relative magnitudes of constraint forces, also called Lagrange multipliers

## Dynamics with Constraints

- 3 Steps for calculating the equation of motion with constraints
(1) Write the equations of motion (done, but Lagrange multipliers are unknown)
(2) Solve these multipliers because each $\lambda_{i}$ will be a function with $q, \dot{q}, \Upsilon$
(3) Substituting them back into the equations of motion
- We will show how to solve the multipliers $\lambda$ in (2):
- Differentiate the constraint equation $A(q) \dot{q}=0 \quad$ (6.3) $\Rightarrow A(q) \ddot{q}+\dot{A}(q) \dot{q}=0$ (6.3.1)
- Write Lagrange's equations like this $M(q) \ddot{q}+C(q, \dot{q}) \dot{q}+N(q, \dot{q})+A^{T}(q) \lambda=F, \quad$ (6.5)
- Solve (6.5) for $\ddot{q}$ and substitute into (6.3.1), and we will get

$$
\left(A M^{-1} A^{T}\right) \lambda=A M^{-1}(F-C \dot{q}-N)+\dot{A} \dot{q},
$$

If constraints are independent, this matrix is full rank

- So finally $\quad \lambda=\left(A M^{-1} A^{T}\right)^{-1}\left(A M^{-1}(F-C \dot{q}-N)+\dot{A} \dot{q}\right)$.

## Dynamics with Constraints

- Configuration $q=(x, y) \in \mathbb{R}^{2}$
- Constraint $x^{2}+y^{2}=l^{2}$
(1) Write the equations of motion
(2) Solve these multipliers
(3) Substituting them back into the equations of motion
- Pfaffian constraint $\underbrace{\left[\begin{array}{ll}x & y\end{array}\right]}_{A(q)}\left[\begin{array}{l}\dot{x} \\ \dot{y}\end{array}\right]=0$
- No constraint Lagrangian $L(q, \dot{q})=\frac{1}{2} m\left(\dot{x}^{2}+\dot{y}^{2}\right)-m g y$.
- Substitude these formulation into $\frac{d}{d t} \frac{\partial L}{\partial \dot{q}}-\frac{\partial L}{\partial q}+A^{T}(q) \lambda=0$,
- So Lagrangian with constraint will be:

Unknown, let's

## Dynamics with Constraints

(1) Write the equations of motion
(2) Solve these multipliers
(3) Substituting them back into the equations of motion

- Solve Lagrange Multipliers using this:

$$
\begin{aligned}
\lambda & =\left(A M^{-1} A^{T}\right)^{-1}\left(A M^{-1}(Q-C \dot{q}-N)-\dot{A} \dot{q}\right) \\
& =\frac{m}{x^{2}+y^{2}}\left(-g y-\dot{x}^{2}-\dot{y}^{2}\right)=-\frac{m}{l^{2}}\left(g y+\dot{x}^{2}+\dot{y}^{2}\right)
\end{aligned}
$$

## Dynamics with Constraints

(1) Write the equations of motion
(2) Solve these multipliers
(3) Substituting them back into the equations of motion

$$
\begin{aligned}
& {\left[\begin{array}{cc}
m & 0 \\
0 & m
\end{array}\right]\left[\begin{array}{c}
\ddot{x} \\
\ddot{y}
\end{array}\right]+\left[\begin{array}{c}
0 \\
m g
\end{array}\right]+\left[\begin{array}{c}
x \\
y
\end{array}\right] \lambda=0 } \\
& \searrow_{-\frac{m}{l^{2}}\left(g y+\dot{x}^{2}+\dot{y}^{2}\right)}
\end{aligned}
$$

- Finally the equations of motion are:

$$
\left[\begin{array}{cc}
m & 0 \\
0 & m
\end{array}\right]\left[\begin{array}{c}
\ddot{x} \\
\ddot{y}
\end{array}\right]+\left[\begin{array}{c}
0 \\
m g
\end{array}\right]-\frac{1}{l^{2}}\left[\begin{array}{c}
x \\
y
\end{array}\right]\left(m g y+m\left(\dot{x}^{2}+\dot{y}^{2}\right)\right)=0
$$

## Dynamics with Constraints

(1) Write the equations of motion
(2) Solve these multipliers
(3) Substituting them back into the equations of motion

$$
\left[\begin{array}{cc}
m & 0 \\
0 & m
\end{array}\right]\left[\begin{array}{c}
\ddot{x} \\
\ddot{y}
\end{array}\right]+\left[\begin{array}{c}
0 \\
m g
\end{array}\right]-\frac{1}{l^{2}}\left[\begin{array}{l}
x \\
y
\end{array}\right]\left(m g y+m\left(\dot{x}^{2}+\dot{y}^{2}\right)\right)=0 .
$$

- This is a second-order differential equation in two variables $x, y$
- But system only has one degree of freedom

- Thus, we have increased the number of variables required to represent the motion of the system.
- Additionally, we can obtain constraint force: tension $T$ in the rod:

$$
\text { Tension }=\left\|\left[\begin{array}{l}
x \\
y
\end{array}\right] \lambda\right\|=\frac{m g}{l} y+\frac{m}{l}\left(\dot{x}^{2}+\dot{y}^{2}\right)
$$

## Lagrange-D'Alembert Equation

This example can show that constraint forces do no work

- D'Alembert's principle: constraint forces do no work for any instantaneous motion which satisfies the constraints.
- Given configuration $\boldsymbol{q} \in \mathbb{R}^{n}$,
- Virtual displacement $\delta \boldsymbol{q} \in \mathbb{R}^{n}$, an arbitrary infinitesimal displacement which satisfies the constraints $A(q) \delta q=0$.

$$
\left(A^{T}(q) \lambda\right) \cdot \delta q=0
$$

- The reason why we introduce D'Alembert's principle:
- Solving equations of motion without calculating constraint forces?
- Obtain a more concise equation of the dynamics

$$
\frac{d}{d t} \frac{\partial L}{\partial \dot{q}}-\frac{\partial L}{\partial q}+\underbrace{}_{\begin{array}{c}
\text { Constraint } \\
\text { forces }
\end{array} \underbrace{A^{T}(q) \lambda}_{\begin{array}{c}
\text { Nonconservative and } \\
\text { externally applied } \\
\text { forces }
\end{array}}-\Upsilon=0,} \quad \Rightarrow \quad\left(\frac{d}{d t} \frac{\partial L}{\partial \dot{q}}-\frac{\partial L}{\partial q}-\Upsilon\right) \cdot \delta q=0
$$

## Lagrange-D'Alembert Equation

- Let's use Lagrange-d'Alembert equation to solve the dynamics for a rolling disk

A rolling disk that rolls without slipping

- Configuration $q=(x, y, \theta, \phi)$
- Velocity constraints

$$
\begin{array}{r}
\dot{x}-\rho \cos \theta \dot{\phi}=0 \\
\dot{y}-\rho \sin \theta \dot{\phi}=0
\end{array} \quad \text { or } \quad A(q) \dot{q}=\left[\begin{array}{cccc}
1 & 0 & 0 & -\rho \cos \theta \\
0 & 1 & 0 & -\rho \sin \theta
\end{array}\right] \dot{q}=0 .
$$

${ }^{\circ} \tau_{\theta}$ : driving torque on the wheel
${ }^{\circ} \tau_{\phi}$ : steering torque (about the vertical axis)
${ }^{\circ} \mathcal{I}_{\infty}$ : inertia about the horizontal (rolling) axis

- $\mathcal{I}_{\in}$ :inertia about the vertical axis
- Lagrangian will be:

$$
L(q, \dot{q})=\frac{1}{2} m\left(\dot{x}^{2}+\dot{y}^{2}\right)+\frac{1}{2} \mathcal{I}_{\infty} \dot{\theta}^{\epsilon}+\frac{\infty}{\epsilon} \mathcal{I}_{\in} \dot{\phi}^{\epsilon} . \Leftrightarrow L(q, \dot{q})=\frac{1}{2}\left(\dot{x}^{2}+\dot{y}^{2}\right)+\frac{1}{2} \mathcal{I}_{\infty} \dot{\theta}^{2}+\frac{1}{2} \mathcal{I}_{\in} \dot{\phi}^{2}
$$

## Lagrange-D'Alembert Equation

(1) Write the equations of motion
(2) Reduce the configuration
(3) Further simplify the equation

- Virtual displacement $\delta q=(\delta x, \delta y, \delta \theta, \delta \phi)$
- Lagrange-d'Alembert equations

$$
\left(\left[\begin{array}{ccc}
{ }^{m} & & 0 \\
& & \\
& & \mathcal{I}_{\infty} \\
& & \\
& & \mathcal{I}_{\epsilon}
\end{array}\right] \ddot{q}-\left[\begin{array}{c}
0 \\
0 \\
\tau_{\theta} \\
\tau_{\phi}
\end{array}\right]\right) \cdot \delta q=0 \quad \text { where } \quad\left[\begin{array}{cccc}
1 & 0 & 0 & -\rho \cos \theta \\
0 & 1 & 0 & -\rho \sin \theta
\end{array}\right] \delta q=0 .
$$

## Lagrange-D'Alembert Equation

(1) Write the equations of motion
(2) Reduce the configuration
(3) Further simplify the equation

- Virtual displacement $\delta q=(\delta x, \delta y, \delta \theta, \delta \phi)$
- Lagrange-d'Alembert equations

$$
\begin{aligned}
& \left(\left[\begin{array}{ccc}
{ }^{m} & 0 & 0 \\
& m & \mathcal{I}_{\infty} \\
& 0 & \\
& & \\
\mathcal{I}_{\epsilon}
\end{array}\right] \ddot{q}-\left[\begin{array}{c}
0 \\
0 \\
\tau_{\theta} \\
\tau_{\phi}
\end{array}\right]\right) \cdot \delta q=0 \text { where } \quad\left[\begin{array}{cccc}
1 & 0 & 0 & -\rho \cos \theta \\
0 & 1 & 0 & -\rho \sin \theta
\end{array}\right] \delta q=0 . \\
& \delta x=\rho \cos \theta \delta \phi \\
& \delta y=\rho \sin \theta \delta \phi . \\
& \text { - Equation can be written without } \delta x, \delta y \\
& \delta y=\rho \sin \theta \delta \phi .
\end{aligned}
$$

$$
\left(\left[\begin{array}{cc}
0 & 0 \\
m \rho \cos \theta & m \rho \sin \theta
\end{array}\right]\left[\begin{array}{l}
\ddot{x} \\
\ddot{y}
\end{array}\right]+\left[\begin{array}{cc}
\mathcal{I}_{\infty} & 0 \\
0 & \mathcal{I}_{\epsilon}
\end{array}\right]\left[\begin{array}{c}
\ddot{\theta} \\
\ddot{\phi}
\end{array}\right]-\left[\begin{array}{c}
\tau_{\theta} \\
\tau_{\phi}
\end{array}\right]\right) \cdot\left[\begin{array}{l}
\delta \theta \\
\delta \phi
\end{array}\right]=0,
$$

- Since $\delta \theta, \delta \phi$ are free, the dynamics become:

$$
\left[\begin{array}{cc}
0 & 0 \\
m \rho \cos \theta & m \rho \sin \theta
\end{array}\right]\left[\begin{array}{l}
\ddot{x} \\
\ddot{y}
\end{array}\right]+\left[\begin{array}{cc}
\mathcal{I}_{\infty} & 0 \\
0 & \mathcal{I}_{\in}
\end{array}\right]\left[\begin{array}{l}
\ddot{\theta} \\
\ddot{\phi}
\end{array}\right]=\left[\begin{array}{c}
\tau_{\theta} \\
\tau_{\phi}
\end{array}\right]
$$

## Lagrange-D'Alembert Equation

(1) Write the equations of motion
(2) Reduce the configuration
(3) Further simplify the equation

- We have dynamics equation:

$$
\left[\begin{array}{cc}
0 & 0 \\
m \rho \cos \theta & m \rho \sin \theta
\end{array}\right]\left[\begin{array}{l}
\ddot{x} \\
\ddot{y}
\end{array}\right]+\left[\begin{array}{cc}
\mathcal{I}_{\infty} & 0 \\
0 & \mathcal{I}_{\in}
\end{array}\right]\left[\begin{array}{l}
\ddot{\theta} \\
\ddot{\phi}
\end{array}\right]=\left[\begin{array}{c}
\tau_{\theta} \\
\tau_{\phi}
\end{array}\right]
$$

- We can eliminate $\dot{x}, \dot{y}$ and $\ddot{x}, \ddot{y}$ by differentiating the constraints

$$
\begin{array}{r}
\dot{x}-\rho \cos \theta \dot{\phi}=0 \\
\dot{y}-\rho \sin \theta \dot{\phi}=0
\end{array} \quad \Rightarrow \quad \begin{aligned}
& \ddot{x}=\rho \cos \theta \ddot{\phi}-\rho \sin \theta \dot{\theta} \dot{\phi} \\
& \ddot{y}=\rho \sin \theta \ddot{\phi}+\rho \cos \theta \dot{\theta} \dot{\phi},
\end{aligned}
$$

- Finally, it's second-order differential equation in $\theta$ and $\phi$

$$
\left[\begin{array}{cc}
\mathcal{I}_{\infty} & 0 \\
0 & \mathcal{I}_{\in}+\mathbb{I} \rho^{\in}
\end{array}\right]\left[\begin{array}{l}
\ddot{\theta} \\
\ddot{\phi}
\end{array}\right]=\left[\begin{array}{c}
\tau_{\theta} \\
\tau_{\phi}
\end{array}\right],
$$

## Lagrange-D'Alembert Equation

(1) Write the equations of motion
(2) Reduce the configuration
(3) Further simplify the equation

- Let's summarize this rolling disk dynamics (a nonholonomic system).
- Given the trajectory of $\theta$ and $\phi$, we can determine the trajectory of the disk as it rolls along the plane.
- The equation of motion is $1+2$

1. A second-order equations in a reduced set of variables plus

$$
\left[\begin{array}{cc}
\mathcal{I}_{\infty} & 0 \\
0 & \mathcal{I}_{\in}+\hat{I} \rho^{\in}
\end{array}\right]\left[\begin{array}{l}
\ddot{\theta} \\
\ddot{\phi}
\end{array}\right]=\left[\begin{array}{c}
\tau_{\theta} \\
\tau_{\phi}
\end{array}\right]
$$

2. A set of first-order equations

$$
\begin{aligned}
\dot{x} & =\rho \cos \theta \dot{\phi} \\
\dot{y} & =\rho \sin \theta \dot{\phi}
\end{aligned}
$$

## Lagrange-D'Alembert Equation

- Let's wrap it up with mathematical formulations
- Goal: get a more explicit description of the dynamics
- Lagrange-d'Alembert equation $\left(\frac{d}{d t} \frac{\partial L}{\partial \dot{q}}-\frac{\partial L}{\partial q}-\Upsilon\right) \cdot \delta q=0$, where $\delta q \in \mathbb{R}^{n}$ satisfies $A(q) \delta q=0$.
- Rewrite these:

$$
A(q)=\left[\begin{array}{ll}
A_{1}(q) & A_{2}(q)
\end{array}\right], \quad q=\left(q_{1}, q_{2}\right) \in \mathbb{R}^{n-k} \times \mathbb{R}^{k}
$$

- So that we can use $\partial q_{1}$ to eliminate $\partial q_{2}$. ( $\partial q_{1}$ is free or unconstrainted)

$$
\begin{aligned}
& A(q) \cdot \delta q=0 \quad \Longleftrightarrow \quad \delta q_{2}=-A_{2}^{-1}(q) A_{1}(q) \delta q_{1}, \\
& \left(\frac{d}{d t} \frac{\partial L}{\partial \dot{q}}-\frac{\partial L}{\partial q}-\Upsilon\right) \cdot \delta q \\
& \quad=\left(\frac{d}{d t} \frac{\partial L}{\partial q_{1}} \frac{\partial L}{\partial q_{1}} \Upsilon_{1}\right) \cdot \delta q_{1}+\left(\frac{d}{d t} \frac{\partial L}{\partial \dot{q}_{2}}-\frac{\partial L}{\partial q_{2}}-\Upsilon_{2}\right) \cdot \delta q_{2} \\
& \quad=\left(\frac{d}{d t} \frac{\partial L}{\partial q_{1}} \frac{\partial L}{\partial q_{1}}-\Upsilon_{1}\right) \cdot \delta q_{1}+\left(\frac{d}{d t} \frac{\partial L}{\partial q_{2}} \frac{\partial L}{\partial q_{2}}-\Upsilon_{2}\right) \cdot\left(-A_{2}^{-1} A_{1}\right) \delta q_{1},
\end{aligned}
$$

- We can eliminate $\dot{q}_{2}, \ddot{q}_{2}$ using the constraint $\dot{q}_{2}=-A_{2}^{-1} A_{1} \dot{q}_{1}$

## Nonholonomic System

- When we calculate the dynamics for a mechanical system with nonholonomic system
- Wrong: directly substitute the constraints to the equations of motion to eliminate the constraints
- For example:
- Configuration $\quad q=(r, s) \in \mathbb{R}^{2} \times \mathbb{R}$
- Constraints $\dot{s}+a^{T}(r) \dot{r}=0 \quad a(r) \in \mathbb{R}^{2}$, (nonholonomic)
- Lagrangian $\quad L_{c}(r, \dot{r})=L\left(r, \dot{r},-a^{T}(r) \dot{r}\right)$. (for simplicity, assume it doesn't depend on $s$ )
- Substitute Lagrangian to the Lagrange-d'Alembert equation

$$
\frac{d}{d t} \frac{\partial L_{c}}{\partial \dot{r}_{i}}-\frac{\partial L_{c}}{\partial r_{i}}=0 \quad i=1,2 . \Rightarrow \frac{d}{d t}\left(\frac{\partial L}{\partial \dot{r}_{i}}-a_{i}(r) \frac{\partial L}{\partial \dot{s}}\right)-\left(\frac{\partial L}{\partial r_{i}}-\frac{\partial L}{\partial \dot{s}} \sum_{j} \frac{\partial a_{j}}{\partial r_{i}} \dot{r}_{j}\right)=0
$$

- Rearranging terms and we obtain:

$$
\left(\frac{d}{d t} \frac{\partial L}{\partial \dot{r}_{i}}-\frac{\partial L}{\partial r_{i}}\right)-a_{i}(r)\left(\frac{d}{d t} \frac{\partial L}{\partial \dot{s}}-\frac{\partial L}{\partial s}\right)=\frac{\partial L}{\partial \dot{s}}\left(\dot{a}_{i}(r)-\sum_{j} \frac{\partial a_{j}}{\partial r_{i}} \dot{r}_{i}\right)
$$

## Nonholonomic System

- When we calculate the dynamics for a mechanical system with nonholonomic system
- Wrong: directly substitute the constraints to the equations of motion to eliminate the constraints
- For example:
- Let's look at the final equations

$$
\left(\frac{d}{d t} \frac{\partial L}{\partial \dot{r}_{i}}-\frac{\partial L}{\partial r_{i}}\right)-a_{i}(r)\left(\frac{d}{d t} \frac{\partial L}{\partial \dot{s}}-\frac{\partial L}{\partial s}\right)=\frac{\partial L}{\partial \dot{s}}\left(\dot{a}_{i}(r)-\sum_{j} \frac{\partial a_{j}}{\partial r_{i}} \dot{r}_{i}\right)
$$

Exactly Lagrange-d'Alembert equation
Spurious terms

- If we directly substitute the constraints to the equations of motion, we will get these spurious terms, the final dynamic equations are wrong

## Holonomic System

- When we calculate the dynamics for a mechanical system with nonholonomic system
- Wrong: directly substitute the constraints to the equations of motion to eliminate the constraints
- Is it still wrong for a holonomic system?
- We know the constraint is integrable, so that there exists $h(r)$ such that

$$
\dot{s}+a^{T}(r) \dot{r}=0 \quad a(r) \in \mathbb{R}^{2}, \quad \Rightarrow \quad a_{i}(r)=\frac{\partial h}{\partial r_{i}}
$$

- So that for the right side $\left(\frac{d}{d t} \frac{\partial L}{\partial \dot{r}_{i}}-\frac{\partial L}{\partial r_{i}}\right)-a_{i}(r)\left(\frac{d}{d t} \frac{\partial L}{\partial \dot{s}}-\frac{\partial L}{\partial s}\right)=\frac{\partial L}{\partial \dot{s}}\left(\dot{a}_{i}(r)-\sum_{j} \frac{\partial a_{j}}{\partial r_{i}} \dot{r}_{i}\right) \cdot$.

$$
\frac{\partial L}{\partial \dot{s}}\left(\dot{a}_{i}(r)-\sum_{j} \frac{\partial a_{j}}{\partial r_{i}} \dot{r}_{i}\right)=\frac{\partial L}{\partial \dot{s}}\left(\sum \frac{\partial^{2} h}{\partial r_{i} \partial r_{j}} \dot{r}_{j}-\sum \frac{\partial^{2} h}{\partial r_{j} \partial r_{i}} \dot{r}_{i}\right),=\mathbf{0}
$$

- So for a holonomic system, if we substitute the constraints to the equations of motion, we can still get a correct equations of motion

## Contents of This Talk

## Equation of Motion

OWONIK ROBOTICS
$\left[\begin{array}{cc}m I & 0 \\ 0 & \mathcal{I}\end{array}\right]\left[\begin{array}{c}\dot{v}^{b} \\ \dot{\omega}^{b}\end{array}\right]+\left[\begin{array}{c}\omega^{b} \times m v^{b} \\ \omega^{b} \times \mathcal{I} \omega\end{array}\right]=F^{b}$,
In Newton-Euler method: object $x_{o}=(p, R) \in S E(3)$
If object is subject to gravity alone:

$$
\left[\begin{array}{cc}
m I & 0 \\
0 & \mathcal{I}
\end{array}\right] \dot{V}^{b}+\left[\begin{array}{cc}
m \widehat{\omega}^{b} & 0 \\
0 & \frac{1}{2}\left(\widehat{\omega}^{b} \mathcal{I}-\mathcal{I} \widehat{\omega} \mathrm{L}\right)
\end{array}\right] V^{b}+\left[\begin{array}{c}
R^{T}(m \vec{g}) \\
0
\end{array}\right]=0,
$$

## Equation of Motion

We have to convert object from $S E$ (3) to local coordinate, which is:
$x_{o}=(p, R) \in S E(3) \Rightarrow x \in \mathbb{R}^{6}$
So that the object dynamics can be written as:

$$
M_{o}(x) \ddot{x}+C_{o}(x, \dot{x}) \dot{x}+N_{o}(x, \dot{x})=0
$$

OWONIK ROBOTICS

$$
J_{h}(\theta, x) \dot{\theta}=G^{T}(\theta, x) \dot{x}, \quad \begin{aligned}
& \text { It's the relationship between the finger } \\
& \text { velocity and object velocity }
\end{aligned}
$$

Three assumptions of grasping

1) The grasp is force-closure and manipulable
2) The hand Jacobian is invertible
3) The contact forces remain in the friction cone at all times

## Equation of Motion

## Dynamics of the system

 (Apply Lagrangian-d'Alembert equation)Recall Lagrangian-d'Alembert equation

$$
\begin{gathered}
\left(\frac{d}{d t} \frac{\partial L}{\partial \dot{q}}-\frac{\partial L}{\partial q}-\Upsilon\right) \cdot \delta q=0 \\
A(q) \delta q=0
\end{gathered}
$$

- Configuration: $q=(\theta, x)$
- Lagrangian: $L=\frac{1}{2} \dot{\theta}^{T} M_{f} \dot{\theta}+\frac{1}{2} \dot{x}^{T} M_{o} \dot{x}-V_{f}(\theta)-V_{o}(x)$,
- Virtual displacement: $\delta q=(\delta \theta, \delta x)$
- Constraint: $J_{h}(\theta, x) \dot{\theta}=G^{T}(\theta, x) \dot{x}, \quad\left[\begin{array}{ll}-J_{h} & G^{T}\end{array}\right]\left[\begin{array}{c}\dot{\theta} \\ \dot{x}\end{array}\right]=0$
- Lagrange-d'Alembert equations:

Apply steps from last section to using Lagrangian-d'Alembert equation
(1) Write the equations of motion
(2) Reduce the configuration
(3) Further simplify the equation

$$
\begin{aligned}
\left(\frac{d}{d t} \frac{\partial L}{\partial \dot{q}}-\frac{\partial L}{\partial q}-\left[\begin{array}{l}
\tau \\
0
\end{array}\right]\right) \cdot \delta q & =\left[\begin{array}{c:c}
\frac{d}{d t} \frac{\partial L}{\partial \dot{\theta}}-\frac{\partial L}{\partial \theta}-\tau \\
\frac{d}{d t} \frac{\partial L}{\partial \dot{x}}-\frac{\partial L}{\partial x}
\end{array}\right] \cdot\left[\begin{array}{c}
\delta \theta \\
\delta x
\end{array}\right] \begin{array}{cc}
-J_{h} & \left.G^{T}\right]\left[\begin{array}{c}
\delta \theta \\
\delta x
\end{array}\right]=0 \\
\delta \theta=J_{h}^{-1} G^{T} \delta x
\end{array} \\
& =\left(\frac{d}{d t} \frac{\partial L}{\partial \dot{\theta}}-\frac{\partial L}{\partial \theta}-\tau\right) \cdot\left(J_{h}^{-1} G^{T} \delta x\right)+\left(\frac{d}{d t} \frac{\partial L}{\partial \dot{x}}-\frac{\partial L}{\partial x}\right) \cdot \delta x \\
& =G J_{h}^{-T}\left(\frac{d}{d t} \frac{\partial L}{\partial \dot{\theta}}-\frac{\partial L}{\partial \theta}-\tau\right) \cdot \delta x+\left(\frac{d}{d t} \frac{\partial L}{\partial \dot{x}}-\frac{\partial L}{\partial x}\right) \cdot \delta x,
\end{aligned}
$$

## Equation of Motion

## Dynamics of the system

(Apply Lagrangian-d'Alembert equation)

- Configuration: $q=(\theta, x)$
- Lagrangian: $L=\frac{1}{2} \dot{\theta}^{T} M_{f} \dot{\theta}+\frac{1}{2} \dot{x}^{T} M_{o} \dot{x}-V_{f}(\theta)-V_{o}(x)$,
- Virtual displacement: $\delta q=(\delta \theta, \delta x)$
- Lagrange-d'Alembert equations:

$$
\left(\frac{d}{d t} \frac{\partial L}{\partial \dot{q}}-\frac{\partial L}{\partial q}-\left[\begin{array}{c}
\tau \\
0
\end{array}\right]\right) \cdot \delta q=G J_{h}^{-T}\left(\frac{d}{d t} \frac{\partial L}{\partial \dot{\theta}}-\frac{\partial L}{\partial \theta}-\tau\right) \cdot \delta x+\left(\frac{d}{d t} \frac{\partial L}{\partial \dot{x}}-\frac{\partial L}{\partial x}\right) \cdot \delta x,=0
$$

- Since $\delta x$ is free:

$$
\left(\frac{d}{d t} \frac{\partial L}{\partial \dot{x}}-\frac{\partial L}{\partial x}\right)+G J_{h}^{-T}\left(\frac{d}{d t} \frac{\partial L}{\partial \dot{\theta}}-\frac{\partial L}{\partial \theta}\right)=G J_{h}^{-T} \tau .
$$

## Equation of Motion

## Dynamics of the system

(Apply Lagrangian-d'Alembert equation)

- Furthermore, eliminate $\dot{\theta}, \ddot{\theta}$, and obtain the final equation of motion:

$$
\left(\frac{d}{d t} \frac{\partial L}{\partial \dot{x}}-\frac{\partial L}{\partial x}\right)+G J_{h}^{-T}\left(\frac{d}{d t} \frac{\partial L}{\partial \dot{\theta}}-\frac{\partial L}{\partial \theta}\right)=G J_{h}^{-T} \tau .
$$

$$
\tilde{M}(q) \ddot{x}+\tilde{C}(q, \dot{q}) \dot{x}+\tilde{N}(q, \dot{q})=F,
$$

$$
\begin{aligned}
\tilde{M} & =M_{o}+G J_{h}^{-T} M_{f} J_{h}^{-1} G^{T} \\
\tilde{C} & =C_{o}+G J_{h}^{-T}\left(C_{f} J_{h}^{-1} G^{T}+M_{f} \frac{d}{d t}\left(J_{h}^{-1} G^{T}\right)\right) \\
\tilde{N} & =N_{o}+G J_{h}^{-T} N_{f} \\
F & =G J_{h}^{-T} \tau
\end{aligned}
$$

## Equation of Motion (conclusion)

- Equation of motion for robot hand

$$
\begin{aligned}
& \tilde{M}(q) \ddot{x}+\tilde{C}(q, \dot{q}) \dot{x}+\tilde{N}(q, \dot{q})=F, \\
& \quad \tilde{M}=M_{o}+G J_{h}^{-T} M_{f} J_{h}^{-1} G^{T} \\
& \quad \tilde{C}=C_{o}+G J_{h}^{-T}\left(C_{f} J_{h}^{-1} G^{T}+M_{f} \frac{d}{d t}\left(J_{h}^{-1} G^{T}\right)\right) \\
& \tilde{N}=N_{o}+G J_{h}^{-T} N_{f} \\
& F=G J_{h}^{-T} \tau . \quad \text { If a grasp is force-closure, this term is internal forces }
\end{aligned}
$$

- Properties of the derived equation of motion (Temporally Proof omitted)

1. $\tilde{M}(q)$ is symmetric and positive definite.
2. $\dot{\tilde{M}}(q)-2 \tilde{C}$ is a skew-symmetric matrix.

## Finding Contact Force

- Goal: Find the instantaneous contact forces during motion.
- Internal forces: if a grasp is force-closure, then there exist contact forces which produce no net wrench on the object.
- In dynamics, internal forces $F=G J_{h}^{-T} \tau$ maps joint torques into object forces.
- If $J_{h}^{-T} \tau \in \mathcal{N}(\mathcal{G})$, no net wrench is generated
- But even if $J_{h}^{-T} \tau \notin \mathcal{N}(\mathcal{G})$, internal forces still exists due to those constraint forces which the Lagrange-d'Alembert equations eliminated.
- Recall full equation of motion with pfaffian constraints:

$$
\begin{aligned}
& \frac{d}{d t} \frac{\partial L}{\partial \dot{q}}-\frac{\partial L}{\partial q}+A^{T}(q) \lambda-\Upsilon=0, \quad A(q)=\left[-J_{h}(\theta, x) \quad G^{T}(\theta, x)\right] \\
& {\left[\begin{array}{cc}
M_{f} & 0 \\
0 & M_{o}
\end{array}\right]\left[\begin{array}{l}
\ddot{\theta} \\
\ddot{x}
\end{array}\right]+\left[\begin{array}{cc}
C_{f} & 0 \\
0 & C_{o}
\end{array}\right]\left[\begin{array}{c}
\dot{\theta} \\
\dot{x}
\end{array}\right]+\left[\begin{array}{c}
N_{f} \\
N_{o}
\end{array}\right]+\left[\begin{array}{c}
-J_{h}^{T} \\
G
\end{array}\right] \lambda=\left[\begin{array}{c}
\tau \\
0
\end{array}\right] \begin{array}{l}
\text { Lagrangian multiplier } \lambda: \\
\text { contact forces }
\end{array}}
\end{aligned}
$$

## Finding Contact Force

- Solve for Lagrange multiplier using results in Section 1.2. Lagrange Multipliers

$$
\begin{aligned}
& {\left[\begin{array}{cc}
M_{f} & 0 \\
0 & M_{0}
\end{array}\right]}
\end{aligned}\left[\begin{array}{l}
\ddot{\theta} \\
\ddot{x}
\end{array}\right]+\underbrace{\left[\begin{array}{cc}
C_{f} & 0 \\
0 & C_{o}
\end{array}\right]}_{\bar{C}}\left[\begin{array}{c}
\dot{\theta} \\
\dot{x}
\end{array}\right]+\underbrace{\left[\begin{array}{c}
N_{f} \\
N_{o}
\end{array}\right]}_{\bar{N}}+\left[\begin{array}{c}
-J_{h}^{T} \\
G
\end{array}\right] \lambda=\left[\begin{array}{c}
\tau \\
0
\end{array}\right]
$$

- Another method to solve for constraint forces
- If $J_{h}$ is invertible, directly using the joint acceleration.

$$
\lambda=J_{h}^{-T}\left(\tau-M_{f} \ddot{\theta}-C_{f} \dot{\theta}-N_{f}\right) .
$$

## Other Robot Systems

- Let's see some examples.
- Robot system subject to constrains of $J(q) \dot{\theta}=G^{T}(q) \dot{x}$ have dynamics with the same form and structure we introduced before.

## Coordinated lifting

$$
\underbrace{\left[\begin{array}{ccc}
\operatorname{Ad}_{g_{s_{1} t_{1}}}^{-1} & J_{s_{1} t_{1}}^{s} & \\
\\
& \ddots & 0 \\
0 & & \operatorname{Ad}_{g_{s_{k} t_{k}}}^{-1} J_{s_{k} t_{k}}^{s}
\end{array}\right]}_{J} \dot{\theta}=\underbrace{\left[\begin{array}{c}
\mathrm{Ad}_{g_{o t_{1}}}^{-1} \\
\vdots \\
\operatorname{Ad}_{g_{o t_{k}}}^{-1}
\end{array}\right]}_{G^{T}} V_{p o}^{b}
$$

## Other Robot Systems

```
Workspace dynamics
```

Motoman robot performing a welding task Robot grasping a welding tool

$$
M_{o}(x) \ddot{x}+C_{o}(x, \dot{x}) \dot{x}+N_{o}(x, \dot{x})=0
$$

## Dynamics of the system

- $\quad g: Q \rightarrow \mathbb{R}^{p} \quad$, Jacobian: $J(\theta)=\frac{\partial g}{\partial \theta}$
- Kinematics: $J(\theta) \dot{\theta}=\dot{x}$,
- Dynamics: $\tilde{M}(q) \ddot{x}+\tilde{C}(q, \dot{q}) \dot{x}+\tilde{N}(q, \dot{q})=F$,

$$
\tilde{M}=M_{o}+J^{-T} M_{f} J^{-1}
$$

$$
\tilde{C}=C_{o}+J^{-T}\left(C_{f} J^{-1}+M_{f} \frac{d}{d t}\left(J^{-1}\right)\right)
$$

$$
\tilde{N}=N_{o}+J^{-T} N_{f}
$$

$$
F=J^{-T} \tau
$$

## Other Robot Systems

```
Hybrid position/force dynamics
```

- This kind of tasks consist of both a desired motion and a desired force
- Constraint: $h(\theta, x)=0$

$$
\underbrace{\frac{\partial h}{\partial \theta}}_{J} \dot{\theta}=\underbrace{-\frac{\partial h}{\partial x}}_{G^{T}} \dot{x}
$$

- Dynamics: $\tilde{M}(q) \ddot{x}+\tilde{C}(q, \dot{q}) \dot{x}+\tilde{N}(q, \dot{q})=F$,

$$
\begin{aligned}
\tilde{M} & =G J^{-T} M_{f} J^{-1} G^{T} \\
\tilde{C} & =G J^{-T}\left(C_{f} J^{-1} G^{T}+M_{f} \frac{d}{d t}\left(J^{-1} G^{T}\right)\right) \\
\tilde{N} & =N_{o}+G J^{-T} N_{f} \\
F & =G J^{-T} \tau .
\end{aligned}
$$

## Contents of This Talk

- Kinematics and Statics of Tendon Actuation
- Control of Robot Hand

## Dynamics for These Robot Systems (conclusion)

- How to analyze dynamics redundant and/or nonmanipulable robot systems subject to constraints?
- Constraints: $J_{h}(\theta, x) \dot{\theta}=G^{T}(\theta, x) \dot{x}$

## Redundant

## Nonmanipulable

Constraints introduce kinematic/actuator redundancy into robot system.

What it is

- Kinematic redundancy :finger motions which do not affect object motion.
- Actuator redundancy : finger forces which do not affect object motion. i.e., Internal forces.
- Manipulable: when arbitrary motions can be generated by fingers
- Nonmanipulable: when finger motion cannot achieve some motions of the individual contacts.

What $J_{h}$ looks like equation of motion

- $J_{h}$ has a non-trivial null space, which describes those joint motions.
- $J_{h}$ is not full row rank
- $J_{h}$ does not span the range of $G^{T}$

Extend the constraints by brining $K_{h}$ which spans the null space of $J_{h}$.

$$
\underbrace{\left[\begin{array}{c}
J_{h} \\
K_{h}
\end{array}\right]}_{\bar{J}_{h}} \dot{\theta}=\underbrace{\left[\begin{array}{cc}
G^{T} & 0 \\
0 & I
\end{array}\right]}_{\bar{G}^{T}}\left[\begin{array}{c}
\dot{x} \\
v_{N}
\end{array}\right]
$$

Rewrite the constraints by bringing $H$ which spans the space of allowable object trajectories.

$$
J_{h} \dot{\theta}=\underbrace{G^{T} H}_{\bar{G}^{T}} w
$$

## Examples: Two-fingered SCARA grasp

- Write the basic grasp constraints:
$\begin{aligned} & 8 \uparrow\left[\begin{array}{cc}J_{h 1} & 0 \\ 0 & J_{h 2}\end{array}\right] \\ & \overleftrightarrow{8} \dot{\theta}\end{aligned}{ }_{8}^{\left[\begin{array}{l}G_{1}^{T} \\ G_{2}^{T}\end{array}\right]} V_{p o}^{b}$.
Notice this $J_{h}(\theta)$ is not invertible
i. Solve for redundancy
ii. Solve for Nonmanipulable

## Examples: i. Solve for Redundancy

- Define $K$ where $\frac{\partial y}{\partial \theta}=K(\theta)$.
- We define $h(\theta)=\left(\theta_{11}+\theta_{12}+\theta_{13}, \theta_{21}+\theta_{22}+\theta_{23}\right)$

- So that $K_{1}=\left[\begin{array}{llll}1 & 1 & 1 & 0 \\ 0 & 0 & 0 & 0\end{array}\right], K_{2}=\left[\begin{array}{llll}0 & 0 & 0 & 0 \\ 1 & 1 & 1 & 0\end{array}\right]$
- Expand the constraints:

- Notice we increased the internal variables to describe the internal motion. i.e. velocity $\dot{y}$.
- But it does not alter the nonmanipulable nature since $J_{h}$ still does not span the range of $G^{T}$.

## Examples: ii. Solve for Nonmanipulable

- Define the space of allowable object velocities
- $W(\theta, x)=\left\{\dot{x} \in \mathbb{R}^{p}: \exists \dot{\theta} \in \mathbb{R}^{m}\right.$ with $\left.J_{h} \dot{\theta}=G^{T} \dot{x}\right\}$.
$\Uparrow$ It has l dimensions

- i.e. Object can move along [0,1,0,0,0,0] ${ }^{T}$
$\circ$ i.e. But object cannot move along $[0,0,0,0,1,0]^{T}$ (Rotating around Y -axis)
- Next, we construct a matrix $H(\theta, x) \in \mathbb{R}^{p \times l}$ using $W(\theta, x)$
- Every column of $H$ is the allowing object velocity in $W$ (basis) $H=$
- Rewrite grasp constraints:
$\left[\begin{array}{lllll|ll}1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & & 0 \\ 0 & 0 \\ \hline 0 & 0 & 0 & 0 & 0 & & 1 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1\end{array}\right]=\left[\begin{array}{lll}H^{\prime} & 0 \\ \hline 0 & I\end{array}\right]$

$$
\left.10 \underset{8}{\downarrow} \begin{array}{|c|c}
{\left[\begin{array}{c|c}
J_{h 1} & 0 \\
0 & J_{h 2} \\
\hline K_{1} & K_{2}
\end{array}\right]} \\
\dot{\theta} & =\begin{array}{c}
G_{1}^{T} H^{\prime} \\
G_{2}^{T} H^{\prime}
\end{array} \\
\hline 0 & 0 \\
\hline 0 & I
\end{array}\right]\left[\begin{array}{c}
w^{\prime} \\
\dot{y}
\end{array}\right]
$$

| Recall rewritten formulation |
| :---: |
| $J_{h} \dot{\theta}=G^{T} H w$ |
| $\dot{x}=H w, \quad$$\dot{x} \in \mathbb{R}^{p}:$ object velocity <br> $w \in \mathbb{R}^{l}:$ object velocity in <br> terms of the basis of $H$ |

## Contents of This Talk

- Recall
- Lagrange's Equations with Constraints
- Robot Hand Dynamics
- Redundant and Nonmanipulable Robot Systems
- Kinematics and Statics of Tendon Actuation
- Inelastic tendons
- Elastic tendons
- Analysis and control of tendon-driven fingers
- Control of Robot Hand

## Tendon-Driven Finger

- Introduce a mechanism to carry forces from an actuator to the appropriate joint.
- Model the routing of each tendon by an extension function:
- $h_{i}: Q \rightarrow \mathbb{R}$
- It measures the displacement of tendon end and the joint angles of the finger

○ i.e. $h_{i}(\theta)=l_{i} \pm r_{i 1} \theta_{1} \pm \cdots \pm r_{i n} \theta_{n}$
ㄴ ᄂـ
$l_{i}$ : Nominal extension (at $\theta=0$ )
$r_{i j}$ : radius of the $j$-th joint pulley

A simple tendon-driven finger
Consists of linkages, tendons, gears, and pulleys

## Inelastic Tendons

- Introduce a mechanism to carry forces from an actuator to the appropriate joint.
- Model the routing of each tendon by an extension function:
- $h_{i}: Q \rightarrow \mathbb{R}$
- It measures the displacement of tendon end and the joint angles of the finger

○ i.e. $h_{i}(\theta)=l_{i} \pm r_{i 1} \theta_{1} \pm \cdots \pm r_{i n} \theta_{n}$
ㄴ ᄂـ
$l_{i}$ : Nominal extension (at $\theta=0$ )
$r_{i j}$ : radius of the $j$-th joint pulley

A finger which is actuated by a set of inelastic tendons

## Inelastic Tendons

- Finger examples and their extension functions

Example of tendon routing with non
linear extension function

- Extension functions:
$h_{2}=l_{2}-R_{1} \theta_{1}$
$h_{3}=l_{3}+R_{1} \theta_{1}$.
$h_{1}=l_{1}+2 \sqrt{a^{2}+b^{2}} \cos \left(\tan ^{-1}\left(\frac{a}{b}\right)+\frac{\theta_{1}}{2}\right)-2 b-R_{2} \theta_{2} \quad \theta_{1}>0$.
$h_{4}=l_{4}+R_{1} \theta_{1}+R_{2} \theta_{2}$
- Extension functions:

$$
\begin{align*}
& h_{1}(\theta)=l_{1}+2 \sqrt{a^{2}+b^{2}} \cos \left(\tan ^{-1}\left(\frac{a}{b}\right)+\frac{\theta}{2}\right)-2 b \quad \theta>0 \\
& h_{2}(\theta)=l_{2}+R \theta, \quad \theta>0
\end{align*}
$$

Planar tendon-driven finger

## Inelastic Tendons

- Let's define the relationships between the tendon forces and the joint torques using tendon extension functions.
- Tendon extensions vectors with $p$ tendons: $e=h(\theta) \in \mathbb{R}^{p}$
- Define coupling matrix: $P(\theta)=\frac{\partial h^{T}}{\partial \theta}(\theta)$ mapping tendon forces and the joint torques
- So $\dot{e}=\frac{\partial h}{\partial \theta}(\theta) \dot{\theta}=P^{T}(\theta) \dot{\theta}$.
- Since work done by the tendons must equal that done by the fingers (conservation of energy): $\tau=P(\theta) f$ where $f \in \mathbb{R}^{p}$ is the force applied to the tendons tends.
- Combined kinematics and dynamics:

$$
M(\theta) \ddot{\theta}+C(\theta, \dot{\theta}) \dot{\theta}+N(\theta, \dot{\theta})=P(\theta) f
$$

## Inelastic Tendons

. $\tau=P(\theta) f$
Joint Coupling Tendon
torques matrix forces

- $M(\theta) \ddot{\theta}+C(\theta, \dot{\theta}) \dot{\theta}+N(\theta, \dot{\theta})=P(\theta) f$
- An example

- Extension function

$$
\begin{array}{lll}
h_{2}=l_{2}-R_{1} \theta_{1} & h_{1}=l_{1}+2 \sqrt{a^{2}+b^{2}} \cos \left(\tan ^{-1}\left(\frac{a}{b}\right)+\frac{\theta_{1}}{2}\right)-2 b-R_{2} \theta_{2} & \theta_{1}>0 . \\
h_{3}=l_{3}+R_{1} \theta_{1} . & h_{4}=l_{4}+R_{1} \theta_{1}+R_{2} \theta_{2} &
\end{array}
$$

- Coupling matrix

$$
P(\theta)={\frac{\partial h^{T}}{\partial \theta}}^{T}=\left[\begin{array}{cccc}
-\sqrt{a^{2}+b^{2}} \sin \left(\tan ^{-1}\left(\frac{a}{b}\right)+\frac{\theta_{1}}{2}\right) & -R_{1} & R_{1} & R_{1} \\
-R_{2} & 0 & 0 & R_{2}
\end{array}\right]
$$

## Elastic Tendons

- Applying a single spring element at the base of the tendon:

Planar finger with position-controlled elastic tendons

- Extension functions

$$
\begin{aligned}
h_{1} & =l_{1}+r_{11} \theta_{1}-r_{12} \theta_{2} \\
h_{2} & =l_{2}-r_{21} \theta_{1} \\
h_{3} & =l_{3}+r_{31} \theta_{1} \\
h_{4} & =l_{4}-r_{41} \theta_{1}+r_{42} \theta_{2}
\end{aligned}
$$

- Coupling Matrix

$$
P(\theta)=\frac{\partial h^{T}}{\partial \theta}=\left[\begin{array}{cccc}
r_{11} & -r_{21} & r_{31} & -r_{41} \\
-r_{12} & 0 & 0 & r_{42}
\end{array}\right]
$$

- We also want to establish the relationship between tendon extension and the joint torques using a new coupling matrix

## Elastic Tendons

- Let's define the relationships between the tendon extension and the joint torques using a new coupling matrix.
- Extension of the tendon as commanded by the actuator: $e_{i}$
- Extension of the tendon due to the mechanism: $h_{i}(\theta)$
- Net force applied to tendons: $f_{i}=k_{i}\left(e_{i}+h_{i}(0)-h_{i}(\theta)\right)$
- Define $K$ : diagonal matrix of tendon stiffnesses, where $k_{i}$ is the stiffness of $i$-th tendon

$$
f=K(e+h(0)-h(\theta))
$$

- Write dynamics:

$$
\begin{array}{r}
M(\theta)+C(\theta, \dot{\theta}) \dot{\theta}+N(\theta, \dot{\theta})+\underset{\substack{\text { Models the stiffness of the } \\
\text { tendon network }}}{P K(h(\theta)-h(0))}=P K e \\
S(\theta):=P K(h(\theta)-h(0)) \quad Q:=P K
\end{array}
$$

## Elastic Tendons

## - $\tau=Q e, Q:=P K$ <br> Joint New Tendon

torques coupling extension matrix

- $M(\theta)+C(\theta, \dot{\theta}) \dot{\theta}+N(\theta, \dot{\theta})+P K(h(\theta)-h(0))=P K e$
- An example (top-right finger):
- We already wrote the extension function $h_{1}, h_{2}, h_{3}, h_{4}$ and coupling matrix $P(\theta)$
- Stiffness matrix :

$$
K=\left[\begin{array}{cccc}
k_{1} & 0 & 0 & 0 \\
0 & k_{2} & 0 & 0 \\
0 & 0 & k_{3} & 0 \\
0 & 0 & 0 & k_{4}
\end{array}\right]
$$

- Overall stiffness:

$$
\begin{aligned}
S(\theta) & =P K(h(\theta)-h(0)) \\
& =\left[\begin{array}{cc}
k_{1} r_{11}^{2}+k_{2} r_{21}^{2}+k_{3} r_{31}^{2}+k_{4} r_{41}^{2} & -k_{1} r_{11} r_{12}-k_{4} r_{41} r_{42} \\
-k_{1} r_{11} r_{12}-k_{4} r_{41} r_{42} & k_{1} r_{12}^{2}+k_{4} r_{42}^{2}
\end{array}\right] \theta
\end{aligned}
$$

- New coupling matrix that mapping joint torques and tendon extension

$$
Q=P K=\left[\begin{array}{cccc}
k_{1} r_{11} & -k_{2} r_{21} & k_{3} r_{31} & -k_{4} r_{41} \\
-k_{1} r_{12} & 0 & 0 & k_{4} r_{42}
\end{array}\right]
$$

## Control of Tendon-Driven Fingers

- First, define a tendon network is force-closure:
- For any $\tau \in \mathbb{R}^{n}$ there exists a set of forces $f \in \mathbb{R}^{p}$ such that

$$
P(\theta) f=\tau \quad \text { and } \quad f_{i}>0, i=1, \ldots, p
$$

- So the necessary and sufficient condition is $P$ be surjective and there exist a strictly positive vector of internal forces $f_{N} \in \mathbb{R}^{p}, f_{N, i}>0$ such that $P(\theta) f_{N}=0$
- Verify the necessary number of tendons to construct a force-closure tendon network:
- " $N+1$ " tendon configuration:
- $N$ tendons which generate torques in the opposite direction
- 1 tendon which pulls on all of the joints in one direction
- " $2 N$ " tendon configuration:
- 2 tendons to each joint (total $N$ joints), acting in opposite directions

## Control of Tendon-Driven Fingers

- Next, write the tendon forces for inelastic tendons:

$$
f=P^{+}(\theta) \tau+f_{N}
$$

pseudo-inversed Internal forces to coupling matrix ensure all $h>0$

- Also, let's move on to elastic tendons:
- We must solve the following equations:

$$
P(\theta) K e=\tau \quad \text { and } \quad e_{i}+h_{i}(0)-h_{i}(\theta)>0, i=1, \ldots, p
$$

- How to solve: assume tendon network is force-closure, there exists a vector of extensions $e_{N} \in \mathbb{R}^{p}$ such that $e_{N, i}>0$ and $P K e_{N}=0$, so we will choose very large $e_{N}$ we can obtain:

$$
e=(P K)^{+} \tau+e_{N}
$$

## Control

- Recall some definition in Chapter 4:

A simple model of robot closed-
loop control system

- Actual motion: $\theta$
- Error: $e=\theta_{d}-\theta$
- Constant gain matrices: $K_{v}, K_{p}$
- Dynamics (without constraints): $M(\theta) \ddot{\theta}+C(\theta, \dot{\theta}) \dot{\theta}+N(\theta, \dot{\theta})=\tau$
- Computed torque control law: $\tau=M(\theta)\left(\ddot{\theta}_{d}-K_{v} \dot{e}-K_{p} e\right)+C(\theta, \dot{\theta}) \dot{\theta}+N(\theta, \dot{\theta})$
- Computing torque $\tau=\underbrace{M(\theta) \ddot{\theta}_{d}+C \dot{\theta}+N}_{\tau_{\mathrm{ff}}}+\underbrace{M(\theta)\left(-K_{v} \dot{e}-K_{p} e\right)}_{\tau_{\mathrm{fb}}}$

## Control

- Here, we consider robot hand control as control problems with constraints

| Goal | How to achieve? |
| :---: | :--- |
| i. Tracking a given object/workspace trajectory | Find joint torques which satisfy the tracking requirement |
| ii. Maintaining a desired internal force | Add sufficient internal forces to keep the contact forces <br> inside the appropriate friction cones |

- We derived dvnamics of this kind of constrained svstem

$$
M(q) \ddot{x}+C(q, \dot{q}) \dot{x}+N(q, \dot{q})=F=G J^{-T} \tau
$$

- Error: $e:=x-x_{d}$
- Let's achieve these two goal one by one

## i. Tracking Trajectory

$$
M(q) \ddot{x}+C(q, \dot{q}) \dot{x}+N(q, \dot{q})=F=G J^{-T} \tau
$$

- Given a desired workspace trajectory $x_{d}(\cdot)$
- Computed torque controller:

$$
F=M(q)\left(\ddot{x}_{d}-K_{v} \dot{e}-K_{p} e\right)+C(q, \dot{q}) \dot{x}+N(q, \dot{q})
$$

- From $F=G J^{-T} \tau$ we can find $\tau$ than satisfying $F$ (actually we could find extra $\tau$ that corresponds to internal forces)
- Solve for $\tau$ :

$$
\tau=J^{T} G^{+} F+J^{T} f_{N}
$$

## ii. Maintaining Internal Forces

$$
M(q) \ddot{x}+C(q, \dot{q}) \dot{x}+N(q, \dot{q})=F=G J^{-T} \tau
$$

- $f_{N}$ must be chosen such that the net contact force lies in the friction cone FC
- Two ways to solve for internal forces
- Method 1: compute final control law

$$
\tau=J_{h}^{T} G^{+} F+J_{h}^{T} f_{N, d}
$$

- Method 2: measure the applied internal forces and adjust $f_{N}$ using a second feedback control law.

$$
f=f_{d}+\alpha \int\left(f-f_{d}\right) d t
$$

## Hierarchical Control Structures

- A multifingered robot hand can be modeled as a set of robots which are coupled to each other and an object by a set of velocity constraints
- Let's establish the control system following these steps:

1. Defining robots
2. Attaching robots
3. Controlling robots
4. Building hierarchical controllers

4. Building hierarchical controllers

Hand: asks for current state, $x_{b}$ and $\dot{x}_{b}$
Finger: ask for current state, $x_{f}$ and $\dot{x}_{f}$
Left: read current state, $\theta_{l}$ and $\dot{\theta}_{l}$
Right: read current state, $\theta_{r}$ and $\dot{\theta}_{r}$
Finger: $x_{f}, \dot{x}_{f} \leftarrow f\left(\theta_{T}, \theta_{r}\right), J\left(\dot{\theta}_{l}, \dot{\theta}_{r}\right)$
Hand: $x_{b}, \dot{x}_{b} \leftarrow g\left(x_{f}\right), G^{+T} \dot{x}_{f}$.
